

AGR Allocation for Retail

The AGR Allocation module allows you to accurately and efficiently allocate merchandise, ensuring that each location has the right inventory levels. Having the right stock in the right location and at the right time is crucial within all retail companies to maintain customers satisfaction and maximize sales. For those retailers that have a high number of stores, it can be hard to maintain control and have a good overview of their fast selling stock.

AGR takes a strategic approach to allocations, taking demand trends and fluctuations into account to ensure the more appropriate distribution to guarantee optimum sell-through. A strategic approach is required when allocating merchandise to locations as allocations can be considered as the heart of the merchandise cycle. If sales trends aren't considered for the time duration between when the assortment plan was created and when those same products are allocated, replenishment will not be optimal as the locations that should have received product due to recent trends would not have and therefore will not be replenished accordingly.

Today, many businesses currently employ a manual process within their allocation team, i.e. choosing how much to put where. Automation is the name of the game and the new allocation UI within AGR improves efficiency and accuracy within your business, while minimizing the manual work while still maintain transparency and control.

PO	Allocation no	Product item number	Product item name	Total QTY	Hold back QTY	Total QTY to allocate	Calculated allocation QTY	Final allocation QTY	Store

Features:

-  Automated allocation processes save time and resources
-  Products allocated to stores that are most likely to sell them
-  Users can manually affect future allocations
-  Thorough overview for fast selling stock
-  Right products in the right place at the right time

Automate your Operations

The Allocation module automatically calculates how to split products between locations where they are most likely to sell, ensuring maximum productivity within your business operations. Once an Allocation proposal has been generated, the user is able to see how the system has calculated the split of the merchandise between locations. They are also able to edit the Final Allocation Quantity within the green cells to give you the control you need over your company's final allocation numbers.
